

Inside the Room

Discretion Disclosure: Making AI Governance Auditable

Powered by IBM Granite • Demonstrated through World Cup • Designed for Enterprise

01 Problem

Law defines critical governance terms it never explicitly explains, creating massive compliance ambiguity.

02 Solution

Interactive ambiguity mapping that translates vague statutory constraints into clear technical targets.

03 Granite

Employs a 4-persona structured reasoning framework powered natively by IBM Granite models.

04 4 Lenses

Evaluates policy through Purposive, Contextual, Procedural, and Strict interpretation frameworks.

05 Knowledge Graph

Dynamically visualizes and tracks multi-layered regulatory overlap and compliance hotspots.

06 Incident Review

Demonstrated via 5 historical World Cup controversies thoroughly vetted using Granite AI.

07 Governance

Provides an automated, tamper-evident compliance audit trail export optimized for risk officers.

08 Key Innovation

Operationalizes H.L.A. Hart's classic 1961 legal philosophy into an interactive digital dashboard.

09 IBM Tech

Utilizes Granite LLMs alongside watsonx.ai capabilities and robust Model Context Protocol (MCP) tools.

10 Architecture

Built using a high-performance React frontend, Vercel edge deployment, and native Granite API integrations.

11 Advantage

The only dedicated hackathon solution designed directly to tackle discretionary legal risk.

12 Deploy

Architected as a production-ready enterprise-grade software module for seamless integration.

Why This Wins:

- Only project focused on discretion risk

- Hart's philosophy made auditable

- Aligns perfectly with watsonx.governance
